

**Problem 0.1.** It can be shown that  $\pi_{13}(S^6) = \mathbb{Z}/60$ . Let  $X = S^6 \cup e^{14}$  be obtained by attaching a 14-cell to a  $S^6$  along a generator in  $\pi_{13}(S^6)$ .

- (1) Calculate  $\pi_6(X)$ .
- (2) Calculate  $\pi_{13}(X)$

*Solution.* Attaching a 14-cell along a generator in  $\pi_{13}(S^6) = \mathbb{Z}/60$  trivializes this homotopy group, so  $\pi_{13}(X) \cong 0$ .

By cellular approximation,  $\pi_i(X) = 0$  for  $i < 6$ , so by Hurewicz,  $\pi_6(X) \cong H_6(X)$ , and it is clear that  $H_6(X) \cong \mathbb{Z}$  by cellular homology.

**Problem 0.2.** Compute  $H_*(\Omega(S^3 \vee S^3))$ .

*Solution.* We have the homotopy fibration  $\Omega(S^3 \vee S^3) \rightarrow P(S^3 \vee S^3) \rightarrow S^3 \vee S^3$ , since the base space is simply-connected, we obtain the following by LSSS:

$$\begin{array}{ccc}
 \vdots & \swarrow & \\
 H_3(\Omega(S^3 \vee S^3)) & \xrightarrow{\cong} & 0 \\
 \downarrow & \swarrow & \\
 H_2(\Omega(S^3 \vee S^3)) & \xrightarrow{\cong} & (\mathbb{Z} \oplus \mathbb{Z}) \otimes (\mathbb{Z} \oplus \mathbb{Z}) \cong \mathbb{Z}^4 \\
 \downarrow & \swarrow & \\
 0 \cong H_1(\Omega(S^3 \vee S^3)) & \xrightarrow{\cong} & 0 \\
 \downarrow & \swarrow & \\
 \mathbb{Z} & \xrightarrow{\quad} & \mathbb{Z} \oplus \mathbb{Z} \longrightarrow \dots
 \end{array}$$

from which we can deduce that

$$H_n(\Omega(S^3 \vee S^3)) \cong \begin{cases} \mathbb{Z}^n, & n \text{ even} \\ 0, & n \text{ odd} \end{cases}$$

**Problem 0.3.** True or false? Briefly justify your answer:

- (1) If an  $n$ -dimensional CW complex is  $n$ -connected, then it is contractible.
- (2) If  $X$  is a simply connected CW complex with finitely many cells, then  $\Omega X$  is weakly equivalent to a CW complex with finitely many cells.
- (3) If  $X$  is an  $n$ -truncated CW complex, then its suspension  $\Sigma X$  is  $(n+1)$ -truncated.

*Solution.* (a) By the Hurewicz theorem, the first nontrivial homology group equals the first nontrivial homotopy group, so if  $\pi_k$  is nontrivial for some  $k > n$ , then  $H_k$  is also nontrivial, but since there are no cells of dimension  $> n$ , we conclude that  $\pi_k = 0$  for all  $k$ . Now the inclusion of a point induces a weak homotopy equivalence, hence it is a homotopy equivalence by Whitehead's theorem, so the space is contractible.

(b) False. If this were true, then the homology groups of  $\Omega X$  would be nontrivial only in finitely many dimensions, but we have just seen that  $H_n(\Omega(S^3 \vee S^3)) \cong \mathbb{Z}^n$

in all even dimensions.

(c) False:  $S^1$  is 2-truncated, but  $S^2$  is not 3-truncated since  $\pi_3(S^2) \cong \mathbb{Z}$  (and  $S^2 = \Sigma S^1$ ).

**Problem 0.4.** Let  $X$  be a simply connected space with homology

$$H_n(X) \cong \mathbb{Z}/n \quad \text{for all } n \geq 1.$$

- (1) Show that  $\pi_k(X)$  is finite for all  $k$ .
- (2) Show that there are infinitely many  $k \in \mathbb{N}$  with  $\pi_k(X) \not\cong 0$ .

*Proof.* (1) Let  $P$  be the set of all primes. Then  $\mathcal{F}_P$  is the set of all finite abelian groups. Now by theorem 1.7 in Hatcher's spectral sequences text, since  $X$  is simply-connected and  $H_n(X) \in \mathcal{C} = \mathcal{F}_p$  for all  $n > 0$ , we have  $\pi_n(X) \in \mathcal{F}_p$  for all  $n > 0$ .

(2) Suppose for contradiction that there are only finitely many nontrivial homotopy groups. Since these are also finite abelian, this means that there is a maximal finite collection  $P$  of primes such that each  $p \in P$  divides the order of some nontrivial homotopy group of  $X$ . Let now  $p \notin P$ . Then by assumption,  $\pi_k \in \mathcal{C} = \mathcal{F}_P$  for all  $k < p$ , so the Hurewicz homomorphism  $h: \pi_p(X) \rightarrow H_p(X) \cong \mathbb{Z}/p$  is an isomorphism mod  $\mathcal{C} = \mathcal{F}_P$ . Hence the cokernel is in  $\mathcal{F}_P$ . But  $\mathbb{Z}/p \notin \mathcal{F}_P$  by assumption, so the image of  $h$  must be all of  $\mathbb{Z}/p$ . But then by the first isomorphism theorem, we obtain  $\pi_p(X)/\ker h \cong \mathbb{Z}/p$ , so in particular,

$$|\pi_p(X)| \cong |\ker h| |\mathbb{Z}/p| = p |\ker h| > 1$$

so  $\pi_p(X)$  is nontrivial, and also has order a multiple of  $p$ , so  $p \in P$ , which is a contradiction. □

**Problem 0.5** (Whitehead tower computation). Let  $\mathbb{RP}^1 \subset \mathbb{RP}^\infty$  be the inclusion. Define  $X = \mathbb{RP}^\infty/\mathbb{RP}^1$  by collapsing  $\mathbb{RP}^1$  to a point.

- (1) Show that  $X$  is simply connected, that

$$H^*(X; \mathbb{Z}) \cong \begin{cases} \mathbb{Z}, & * = 0, 2 \\ \mathbb{Z}/2, & * > 3 \text{ even} \\ 0, & \text{otherwise} \end{cases}$$

and that as a graded ring,  $H^*(X; \mathbb{Z}) \cong \mathbb{Z}[a]/2a^2$  with  $|a| = 2$ .

- (2) Show that there is a homotopy fiber sequence

$$S^1 \rightarrow \tau_{>2}X \rightarrow X$$

and use the cohomological Leray-Serre spectral sequence to compute  $H^*(\tau_{>2}X; \mathbb{Z})$ .

- (3) Show that  $\tau_{>2}X$  is homotopy equivalent to a finite CW complex.
- (4) Is there a finite CW complex with the same homotopy groups as  $X$ ? Briefly justify your answer.

*Solution.* a
